

IN THE ABSTRACT

Please amend the Abstract as follows.

A rotary buckle comprises a female buckling ~~buckling~~ element and a male buckling element. The female buckling element comprises an opening and a buckling portion, wherein a side opposite to the opening comprises a receiving chamber. The male buckle element comprises a fitting portion for fitting into the opening of the female buckling element and a latching portion for buckling position into the buckling portion of the female buckling element, wherein a side opposite to the fitting portion comprises a receiving chamber for receiving a knitted belt, and wherein a track is disposed at a side opposite to the opening of said female buckling element along which a directing element of the receiving chamber of the female buckle can be rotated.
